Acknowledgments

This book is the result of many lectures given at various institutions, including the Bavarian Graduate Program in Economics, the Universities of Dortmund, Dresden, Frankfurt, Glasgow, Louvain-la-Neuve, Mainz, Munich and Würzburg and the European Commission in Brussels. I would therefore first like to thank the students for their questions and discussions. These conversations revealed the most important aspects in understanding model building and in formulating maximization problems.

I also profited from many discussions with economists and mathematicians from many other places. The high download figures at repec.org show that the book is also widely used on an international level. I especially would like to thank Christian Bayer and Ken Sennewald for many insights into the more subtle issues of stochastic continuous time processes. I hope I succeeded in incorporating these insights into this book. I would also like to thank MacKichan for their repeated, quick and very useful support on typesetting issues in Scientific Word.

Edition 1.1 from 2011 is almost identical from the first edition in 2010. Some typos were removed and few explanations were improved. Edition 1.2 exists only as edition 1.2 plus: Textbook and Solutions Manual. Apart from some minor changes as compared to edition 1.1., it includes solutions to selected problem sets as described at the beginning of the Solutions Manual on p. 321.

Mainz, August 2012

Contents

1	Introduction	1
I	Deterministic models in discrete time	7
2	Two-period models and difference equations	11
2.1	Intertemporal utility maximization	11
2.1.1	The setup	11
2.1.2	Solving by the Lagrangian	13
2.2	Examples	14
2.2.1	Optimal consumption	14
2.2.2	Optimal consumption with prices	16
2.2.3	Some useful definitions with applications	17
2.3	The idea behind the Lagrangian	21
2.3.1	Where the Lagrangian comes from I	22
2.3.2	Shadow prices	24
2.4	An overlapping generations model	26
2.4.1	Technologies	27
2.4.2	Households	28
2.4.3	Goods market equilibrium and accumulation identity	28
2.4.4	The reduced form	29
2.4.5	Properties of the reduced form	30
2.5	More on difference equations	32
2.5.1	Two useful proofs	32
2.5.2	A simple difference equation	32
2.5.3	A slightly less but still simple difference equation	35
2.5.4	Fix points and stability	36
2.5.5	An example: Deriving a budget constraint	37
2.6	Further reading and exercises	40
3	Multi-period models	45
3.1	Intertemporal utility maximization	45
3.1.1	The setup	45

V	Solutions manual	319
A	Introduction to solutions to exercises	321
B	Solution to exercises of chapter 2	323
	B.1 Solving by substitution – ex. 2	323
	B.2 General equilibrium – ex. 8	324
	B.3 Difference equations – ex. 10	326
C	Solution to exercises of chapter 3	329
	C.1 The envelope theorem II – ex. 2	329
	C.2 The standard saving problem – ex. 5	330
	C.3 A benevolent central planner – ex. 7	332
D	Solution to exercises of chapter 4	335
	D.1 Phase diagram I – ex. 1	335
	D.2 Phase diagram II – ex. 2	336
	D.3 Solving linear differential equations – ex. 6	338
	D.4 Derivatives of integrals – ex. 8	340
	D.5 Intertemporal and dynamic budget constraints – ex. 9	341
E	Solution to exercises of chapter 5	345
	E.1 Optimal consumption over an infinite horizon – ex. 1	345
	E.2 Optimal consumption – ex. 4	346
	E.3 A central planner – ex. 5	348
	E.4 The Ramsey growth model – ex. 8	352
F	Solution to exercises of chapter 6	355
	F.1 The envelope theorem once again – ex. 1	355
G	Solution to exercises of chapter 7 and 8	357
	G.1 Closed-form solution for a CRRA utility function – ex. 6	357
H	Solutions to exercises of chapter 9	359
	H.1 A household maximization problem – ex. 2	359
	H.2 Labour demand under adjustment cost – ex. 7	360
	H.3 Solving by substitution – ex. 8	361
	H.4 Optimal training for a marathon – ex. 10	361
I	Solutions to exercises of chapter 10	365
	I.1 Differentials of functions of stochastic processes II – ex. 3	365
	I.2 Correlated jump processes – ex. 4	366
	I.3 Deriving a budget constraint – ex. 5	367
	I.4 Solving stochastic differential equations – ex. 12	368

I.5	Dynamic and intertemporal budget constraints - Brownian Motion – ex. 13	370
J	Solution to exercises of chapter 11	373
J.1	Optimal saving under Poisson uncertainty with two state variables – ex. 1	373
J.2	Optimal saving under Brownian motion – ex. 2	375
J.3	Adjustment cost – ex. 3	377

Part V
Solutions manual

Appendix A

Introduction to solutions to exercises

This solutions manual presents solutions to selected exercises. There are not solutions to all exercises simply as not all of the existing solutions are nicely typed, edited and checked for errors at this point. There are solutions to the following exercises.

- Chapter 1 – no exercises
- Chapter 2 – Exercises 2, 8 and 10
- Chapter 3 – Ex. 2, 5 and 7
- Chapter 4 – 1, 2, 6, 8 and 9
- Chapter 5 – 1, 4, 5 and 8
- Chapter 6 – 1
- Chapters 7 and 8 – 6
- Chapter 9 – 2, 7, 8 and 10
- Chapter 10 – 3, 4, 5, 12 and 13
- Chapter 11 – 1, 2 and 3

Any book goes through various stages before actually being “born” in its printed version. This is also true for this book. It started with simple notes, went through its adolescence as various informal versions for the internet and became grown-up via the incorporation of serious and thoughtful comments by referees.

I should probably mention that the solutions manual is not as well-tested as the text itself. While I believe that the solutions are correct, the ideas behind them are not explained in an as elaborated way as in the main text – after all, it is a manual. I am nevertheless sure that it will be very useful for users of this book. As always, any comments are welcome.

The main text has been written word for word by the author of the book. The solutions of the exercises were all suggested by the author. A large group of collaborators have contributed, edited and refined them. They include Ken Sennewald, Christopher Kops and Michael Lamprecht. I am highly grateful to them for their support.

Appendix B

Solution to exercises of chapter 2

B.1 Solving by substitution – ex. 2

From the main text (see equations (2.2.1), (2.1.2) and (2.1.3)) we already know the following equations

$$\text{objective function:} \quad U_t = \gamma \ln c_t + (1 - \gamma) \ln c_{t+1} \quad (\text{B.1.1})$$

$$\text{budget constraint in } t: \quad c_t = w_t - s_t \quad (\text{B.1.2})$$

$$\text{budget constraint in } t + 1: \quad c_{t+1} = w_{t+1} + (1 + r_{t+1})s_t. \quad (\text{B.1.3})$$

Now the principle is to transform this optimization problem with constraints into one without constraints. We therefore insert the budget constraints (B.1.2) and (B.1.3) into our objective function (B.1.1). The unconstrained maximization problem then reads $\max U_t$ by choosing s_t , where

$$U_t = \gamma \ln(w_t - s_t) + (1 - \gamma) \ln(w_{t+1} + (1 + r_{t+1})s_t).$$

The derivative with respect to savings s_t is given by

$$\frac{\gamma}{w_t - s_t} = (1 + r_{t+1}) \frac{1 - \gamma}{w_{t+1} + (1 + r_{t+1})s_t},$$

which represents the first-order condition. When this is solved for savings s_t , we obtain

$$\begin{aligned} \frac{w_{t+1}}{1 + r_{t+1}} + s_t &= (w_t - s_t) \frac{1 - \gamma}{\gamma} \Leftrightarrow \frac{w_{t+1}}{1 + r_{t+1}} = w_t \frac{1 - \gamma}{\gamma} - s_t \frac{1}{\gamma} \Leftrightarrow \\ s_t &= (1 - \gamma)w_t - \gamma \frac{w_{t+1}}{1 + r_{t+1}} = w_t - \gamma W_t, \end{aligned}$$

where W_t is life-time income as defined after (2.2.3).

To show that this is the same result as in (2.2.4) and (2.2.5) we compute first- and second-period consumption and find

$$\begin{aligned} c_t &= w_t - s_t = \gamma W_t \\ c_{t+1} &= w_{t+1} + (1 + r_{t+1})s_t = w_{t+1} + (1 + r_{t+1})(w_t - \gamma W_t) = (1 + r_{t+1})(1 - \gamma)W_t, \end{aligned}$$

where the last equation used again the definition (2.2.3) of life-time income W_t .

- DP 1: Bellman equation and first-order conditions

The optimal programme is $V(q(t)) \equiv \max_{\{l(\tau), l_q(\tau)\}} \Pi(t)$ subject to the constraints. The general Bellman equation reads

$$\rho V(q(t)) = \max_{l(t), l_q(t)} \left\{ \pi(l(t), l_q(t)) + \frac{1}{dt} E_t dV(q(t)) \right\}.$$

With the differential $dV(q(t)) = \{V(q+1) - V(q)\}dq$ and after forming expectations,

$$E_t dV(q(t)) = \{V(q+1) - V(q)\} E_t dq = \{V(q+1) - V(q)\} \lambda(l_q) dt,$$

the specific Bellman equation is

$$\rho V(q(t)) = \max_{l(t), l_q(t)} \{ \pi(l(t), l_q(t)) + \lambda(l_q)[V(q+1) - V(q)] \}.$$

The first-order conditions are

$$\begin{aligned} \pi_l &= \frac{a^q(\varepsilon - 1) \left(\frac{\Phi}{a^q l}\right)^{\frac{1}{\varepsilon}}}{\varepsilon} - w = 0 \Leftrightarrow l(t) = \frac{\Phi \left(\frac{w \cdot \varepsilon}{a^q(t)(\varepsilon - 1)}\right)^{-\varepsilon}}{a^q(t)}, \\ w &= \lambda_{l_q} [V(q+1) - V(q)]. \end{aligned}$$

Exercise 4 d)

We now compute the expected output level for $\tau > t$. We can write output in τ as

$$x(\tau) = aq(\tau) l(\tau) = aq(\tau) \frac{\Phi \left(\frac{w \varepsilon}{aq(\tau)(\varepsilon - 1)}\right)^{-\varepsilon}}{aq(\tau)} = \Phi \left(\frac{\varepsilon - 1}{w \varepsilon}\right)^{\varepsilon} a^{\varepsilon q \tau}.$$

Its mean is

$$\begin{aligned} E_t x(\tau) &= E_t \left(\Phi \left(\frac{\varepsilon - 1}{w \varepsilon}\right)^{\varepsilon} a^{\varepsilon q(\tau)} \right) = \Phi \left(\frac{\varepsilon - 1}{w \varepsilon}\right)^{\varepsilon} E_t (a^{\varepsilon q(\tau)}) \\ &\stackrel{\text{Lemma 8 (section 9.4.1)}}{=} \Phi \left(\frac{\varepsilon - 1}{w \varepsilon}\right)^{\varepsilon} a^{\varepsilon q(t)} e^{(a^{\varepsilon} - 1) \lambda(l_q^*)(\tau - t)}, \quad \tau > t, \end{aligned}$$

where the last step assumed a constant arrival rate.
